Muscle contraction happens at the level of the sarcomere. The sarcomere is comprised of two protein filaments — the thick filament is made of the protein myosin and the thin filament made of the protein actin. (Incidentally, that's why protein consumption is important in muscle development. Protein is the fundamental building block in muscle.)

## **Physiology of Muscles | Baseline of Health**

Human muscle system, the muscles of the human body that work the skeletal system, that are under voluntary control, and that are concerned with movement, posture, and balance. Broadly considered, human muscle—like the muscles of all vertebrates—is often divided into striated muscle, smooth muscle, and cardiac muscle.

## **Anatomy of Muscle Building : Craig Ramsay : 9781554078165**

Muscle is a soft tissue found in most animals. Muscle cells contain protein filaments of actin and myosin that slide past one another, producing a contraction that changes both the length and the shape of the cell. Muscles function to produce force and motion. They are primarily responsible for maintaining and changing posture, locomotion, as well as movement of internal organs, such as the ...
